

Indication: RUQ discomfort, elevated LFTs, obesity.

Technique: Contrast-enhanced CT abdomen/pelvis, 5 mm axial slices.

Findings:

- Liver: hepatomegaly, attenuation 45 HU (low density vs spleen 55 HU).
- Kidneys: cortical thinning, small cyst right kidney.
- Adrenals, pancreas: unremarkable.

Impression: Consistent with moderate hepatic steatosis; early cortical changes suggest CKD stage 2.
