The patient presented with multiple diagnoses, including post-operative complications from exploratory laparoscopy, COPD, inflammatory bowel disease (specifically ulcerative colitis), and atrial fibrillation with rapid ventricular response. Hypertension was also noted.

### **\*\*4. Treatments\*\***

NULL (Insufficient information provided in the JSON data.)

### **\*\*5. Vital Trends\*\***

NULL (Insufficient information provided in the JSON data. Vital signs would typically be included in the physical exam section, but only a GCS score and FiO2 are present.)

### **\*\*6. Lab Trends\*\***

The provided lab data includes a comprehensive panel of blood tests performed at multiple time points, both before and after admission. The tests include complete blood count (CBC) with differential, basic metabolic panel (BMP), and coagulation studies (PT, PTT, INR). There are also measurements of bedside glucose and BNP. Analysis of these trends is crucial for understanding the patient's response to treatment and overall clinical course. Specific numerical values and time offsets are listed in the CSV data section below. Note that some lab results are missing values and there are multiple

entries for the same lab tests at different time points, potentially reflecting serial monitoring. A full interpretation requires the context of the patient's history and clinical picture.

#### **\*\*7. Microbiology Tests\*\***

NULL (Insufficient information provided in the JSON data.)

#### **\*\*8. Physical Examination Results\*\***

A structured physical exam was performed. The Glasgow Coma Scale (GCS) score was recorded as 15 (4 for eyes, 5 for verbal, 6 for motor). The patient's weight was 81.1kg at the time of the exam, and fluid intake and output were documented. FiO2 was recorded as 40%. Further details regarding other aspects of the physical exam are missing.
