Laboratory Trends

The provided data includes a series of laboratory tests conducted at various times during the patient's ICU stay. The tests include blood chemistry (sodium, potassium, chloride, BUN, creatinine, bicarbonate, glucose, anion gap), hematology (RBC, Hgb, Hct, MCV, MCH, MCHC, RDW, WBC x 1000, platelets x 1000, MPV), and bedside glucose measurements. The data shows multiple measurements for many of these parameters, indicating serial monitoring of the patient's condition. Specific trends require further analysis, as the exact timing of measurements is given in minutes from unit admit time, and the specific dates are missing. We can see that glucose levels fluctuated, with values ranging from 72 mg/dL to 117 mg/dL. Creatinine levels were elevated (1.09 - 1.35 mg/dL). Other electrolyte values (sodium, potassium, chloride, bicarbonate) show some variation but remain within a reasonable range, though a more complete picture requires analysis across the entire timeline.
